Got a Project Unique as a Snowflake? Don't Let It Melt!

Snowflake provides enterprises with a flexible, scalable architecture for effective data collaboration. Manta helps you understand the nuances of how data flows and transforms through the Snowflake ecosystem.

Migrate

Legacy systems heating up tensions in your team? Snowflake can help you scale up quickly, but getting your information into Snowflake and fully realizing the benefits can be time-consuming.

Manta can automatically map over 50 technologies to accelerate migration to Snowflake from legacy systems, such as SQL, Oracle, DB2, and COBOL. This means your team can focus on innovation rather than manually mapping dependencies.

Whether your project is already in-flight or you haven't started yet, we've got your back.

Optimize

Impact and root cause analysis can be daunting without effective column-level data lineage.

Manta generates detailed lineage for a comprehensive overview of the journey the data undergoes throughout its lifecycle, including lineage analysis of tasks and streams.

By leveraging Manta to map lineage in Snowflake, users can understand their data in context, increase business agility without sacrificing quality, and deliver data intelligence that fuels growth.

We can help you optimize your Snowflake database and get the most out of the Snowflake platform without sacrificing data quality.

Snowflake components currently supported by Manta:

- Data dictionaries—get lineage for asset catalogs in hierarchical databases
- Scripts—lineage for custom SQL code and ETL activities in Manta’s native UI
- Views—visualize the SQL code logic for user-defined tables to boost data accuracy and trust and speed up reporting
- Functions—extract metadata from Snowflake functions for custom logic and pipeline insights
- External tables—see connections and dependencies across offsite data sources for queried files
- Procedures—experimentally enjoy analysis of dataflow of procedural code

Manta connects to the Snowflake database via jdbc, and automates the extraction and analysis of metadata: including Snowflake SQL and SQL stored procedures.

About Manta

Manta is the world-class automated approach to visualize, optimize, and modernize how data moves through your organization through code-level lineage. Manta automatically scans your data environment with the power of 50+ scanners to build a powerful map of all data pipelines. With Manta, the world’s top companies gain full visibility and control of data pipelines, driving productivity and regaining trust in their data.
